Explain how to build a C++ program that generates random roast messages based on a user's name. No code, only logic.

Summary:
Design a system that takes a user's name, randomly selects roast components from predefined categories, optionally personalizes them, and combines them into a grammatically correct sentence.

---

1. Input Handling

- Accept the user's name as input (string).
- Validate:
  - Not empty
  - Contains valid characters (letters, basic symbols if needed)
- Normalize:
  - Trim spaces
  - Capitalize first letter for clean output

---

2. Roast Data Structure

Create multiple categories of roast fragments. Each category stores several options.

Examples of categories:

- Opening phrases → "Hey", "Listen", "Bro", etc.
- Name-based hooks → "{name}", "Yo {name}"
- Insults → "you have the energy of a broken calculator"
- Comparisons → "like a potato trying to use WiFi"
- End punchlines → "and still failing somehow"

Each category acts like a pool of options.

---

3. Random Selection Logic

- For each category:
  - Generate a random index within the range of that category
  - Select one element
- Ensure randomness:
  - Seed the random generator once (so outputs differ every run)

Optional:

- Prevent repetition of the same roast in one run
- Use weighted randomness for better quality (e.g., some lines more likely)

---

4. Personalization with Name

- Insert the user's name into placeholders like:
  - "{name}"
- Use rules:
  - Sometimes include name, sometimes skip (adds variation)

This approach keeps the system modular, scal[illegible] of generating varied, natural-sounding roast messages without hardcoding full sentences.

Give a step-by-step approach for implementing this in C++. Include data structures and random selection logic.

Summary:
Use predefined text pools stored in C++ containers, select random elements using a properly seeded generator, assemble them using a chosen pattern, and output a formatted sentence.

---

1. Program Structure

Break the program into logical components:

- Input handling
- Data storage (roast fragments)
- Random selection engine
- Sentence construction
- Output formatting

---

2. Data Structures

a) Store roast fragments

Use dynamic containers to hold text pools:

- `vector<string>` for each category:
  - Openers
  - Name hooks
  - Insults
  - Comparisons
  - Punchlines

Reason:

- Easy indexing
- Supports random access
- Flexible size

---

b) Pattern storage

Use one of these:

- `vector<int>` or `enum` to represent patterns
- Or `vector<string>` templates (optional advanced approach)

Example idea:

- Pattern 1 → opener + insult
- Pattern 2 → opener + name + insult + comparis
- Pattern 3 → question-style

Write a beginner-friendly C++ program that:
- Takes user input (name)
- Stores at least 10 roast templates using {name}
- Randomly selects one
- Replaces {name} with the actual name
- Prints output
Add comments.

C++

```cpp
#include <iostream>
#include <vector>
#include <string>
#include <cstdlib>   // for rand() and srand()
#include <ctime>     // for time()

using namespace std;

int main() {
    // Step 1: Seed the random number generator
    srand(time(0));

    // Step 2: Take user input (name)
    string name;
    cout << "Enter your name: ";
    getline(cin, name);

    // Step 3: Store roast templates with {name} placeholder
    vector<string> roasts = {
        "{name}, you have the energy of a phone on 1% battery.",
        "I've seen smarter calculators than you, {name}.",
        "{name}, you're like WiFi with no internet connection.",
        "If laziness were a sport, {name} would still come last.",
        "{name}, even Google can't find your logic.",
        "You remind me of a software bug, {name}. Nobody knows why you exist.",
        "{name}, your brain has more loading time than a slow website.",
        "If confusion had a face, it would be yours, {name}.",
        "{name}, you're like a broken keyboard-nothing works properly.",
        "Even autocorrect gives up on you, {name}."
    };

    // Step 4: Generate a random index
    int randomIndex = rand() % roasts.size();

    // Step 5: Get the selected roast
    string selectedRoast = roasts[randomIndex];

    // Step 6: Replace "{name}" with actual name
    size_t pos = selectedRoast.find("{name}");
    while (pos != string::npos) {
        selectedRoast.replace(pos, 6, name); // 6 = length of "{name}"
        pos = selectedRoast.find("{name}");
    }

    // Step 7: Print the final roast
    cout << "\nRoast: " << selectedRoast << endl;
```

Improve this code:
- Better readability
- Cleaner structure
- Proper variable names
- Ensure randomness works properly

C++

```cpp
#include <iostream>
#include <vector>
#include <string>
#include <random>   // modern random library

using namespace std;

// Function to replace all occurrences of "{name}" with actual name
string replaceNamePlaceholder(const string& templateStr, const string& userName) {
    string result = templateStr;
    size_t position = result.find("{name}");

    while (position != string::npos) {
        result.replace(position, 6, userName); // 6 = length of "{name}"
        position = result.find("{name}");
    }

    return result;
}

int main() {
    // Step 1: Take user input
    string userName;
    cout << "Enter your name: ";
    getline(cin, userName);

    // Step 2: Store roast templates
    vector<string> roastTemplates = {
        "{name}, you have the energy of a phone on 1% battery.",
        "I've seen smarter calculators than you, {name}.",
        "{name}, you're like WiFi with no internet connection.",
        "If laziness were a sport, {name} would still come last.",
        "{name}, even Google can't find your logic.",
        "You remind me of a software bug, {name}. Nobody knows why you exist.",
        "{name}, your brain has more loading time than a slow website.",
        "If confusion had a face, it would be yours, {name}.",
        "{name}, you're like a broken keyboard—nothing works properly.",
        "Even autocorrect gives up on you, {name}."
    };

    // Step 3: Initialize random number generator (better than rand())
    random_device rd;               // seed source
    mt19937 generator(rd());        // Mersenne Twister engine
    uniform_int_distribution<int> distribution(0, roastTemplates.size() - 1);

    // Step 4: Select a random roast
    int randomIndex = distribution(generator);
    string selectedTemplate = roastTemplates[randomIndex];

    // Step 5: Replace placeholder with actual name
    string finalRoast = replaceNamePlaceholder(selectedTemplate, userName);
```

- Cleaner, step-based structure
- Separation of logic (input, processing, output) for readability

Explain how this code works step by step in simple terms.

Summary:
The program asks for a name, randomly picks a roast sentence, replaces `{name}` with the user's name, and prints the result.

Step-by-step explanation

1. Header files

```cpp
#include <iostream>
#include <vector>
#include <string>
#include <random>
```

- `iostream` → for input/output (`cin`, `cout`)
- `vector` → to store multiple roast sentences
- `string` → to handle text
- `random` → for better randomness

---

2. Helper function (replacement logic)

```cpp
string replaceNamePlaceholder(const string& templateStr, const string& userName)
```

What it does:
Replaces every `{name}` in a sentence with the actual user name.

How it works:

1. Copy the original sentence into `result`
2. Find `{name}` using `find()`
3. Replace it using `replace()`
4. Repeat until no `{name}` is left
5. Return the final sentence

---

3. Start of program

```cpp
int main()
```

This is where execution begins

This structure keeps the code clean, readable, and easy to expand (you can just add more roast lines to the vector).

My C++ program is not replacing {name} in the output. Fix the issue and explain the mistake.

Likely issue:
Only the first occurrence of `{name}` is being replaced, or the search isn't repeated after replacement. In C++, `find()` returns only the first match, so you must loop until all occurrences are replaced.

Fixed approach

```cpp
#include <iostream>
#include <string>
using namespace std;

string replaceNamePlaceholder(string text, const string& name) {
    size_t pos = 0;

    // Keep searching and replacing until no "{name}" is left
    while ((pos = text.find("{name}", pos)) != string::npos) {
        text.replace(pos, 6, name);  // 6 = length of "{name}"
        pos += name.length();        // move forward to avoid re-checking same spot
    }

    return text;
}

int main() {
    string sentence = "{name}, you are {name}'s biggest competition.";
    string name = "Maaz";

    string result = replaceNamePlaceholder(sentence, name);
    cout << result << endl;

    return 0;
}
```

What was wrong

1. Replacing only once

If your code looked like:

```cpp
size_t pos = text.find("{name}");
text.replace(pos, 6, name);
```

- It replaces only the **first occurrence**
- Any additional `{name}` remains unchanged

Give the final corrected version of the program with proper formatting and comments.

C++

```cpp
#include <iostream>
#include <vector>
#include <string>
#include <random>

using namespace std;

/*
 Function: replaceNamePlaceholder
 Replaces all occurrences of "{name}" in a string with the actual user name.
*/
string replaceNamePlaceholder(string text, const string& userName) {
    size_t position = 0;

    // Loop until all "{name}" occurrences are replaced
    while ((position = text.find("{name}", position)) != string::npos) {
        text.replace(position, 6, userName);   // 6 = length of "{name}"
        position += userName.length();         // Move forward to continue search
    }

    return text;
}

int main() {
    // Step 1: Take user input
    string userName;
    cout << "Enter your name: ";
    getline(cin, userName);

    // Step 2: Store roast templates
    vector<string> roastTemplates = {
        "{name}, you have the energy of a phone on 1% battery.",
        "I've seen smarter calculators than you, {name}.",
        "{name}, you're like WiFi with no internet connection.",
        "If laziness were a sport, {name} would still come last.",
        "{name}, even Google can't find your logic.",
        "You remind me of a software bug, {name}. Nobody knows why you exist.",
        "{name}, your brain has more loading time than a slow website.",
        "If confusion had a face, it would be yours, {name}.",
        "{name}, you're like a broken keyboard—nothing works properly.",
        "Even autocorrect gives up on you, {name}."
    };

    // Step 3: Initialize random number generator (modern approach)
    random_device seedSource;              // Hardware-based seed
    mt19937 randomEngine(seedSource());    // Mersenne Twister engine
    uniform_int_distribution<int> indexDist(0, roastTemplates.size() - 1);

    // Step 4: Select a random roast template
    int randomIndex = indexDist(randomEngine);
    string selectedTemplate = roastTemplates[randomIndex];

    // Step 5: Replace "{name}" with actual user name
    string finalRoast = replaceNamePlaceholder(selectedTemplate, userName);

    // Step 6: Display result
```
